# TOP500 Supercomputer Sites

*Jack J. Dongarra, Hans W. Meuer, and Erich Strohmaier*

*November 11, 1999*

## Abstract

To provide a better basis for statistics on high-performance computers, we list the sites that have the 500 most powerful computer systems installed. The best LINPACK benchmark performance achieved is used as a performance measure in ranking the computers.

## 1 Introduction and Objectives

Statistics on high-performance computers are of major interest to manufacturers, users, and potential users. These people wish to know not only the number of systems installed, but also the location of the various supercomputers within the high-performance computing community and the applications for which a computer system is being used. Such statistics can facilitate the establishment of collaborations, the exchange of data and software, and provide a better understanding of the high-performance computer market.

Statistical lists of supercomputers are not new. Every year since 1986 Hans Meuer [1] has published system counts of the major vector computer manufacturers, based principally on those at the Mannheim Supercomputer Seminar. Statistics based merely on the name of the manufacturer are no longer useful, however. New statistics are required that reflect the diversification of supercomputers, the enormous performance difference between low-end and high-end models, the increasing availability of massively parallel processing (MPP) systems, and the strong increase in computing power of the high-end models of workstation suppliers (SMP).

To provide this new statistical foundation, we have decided in 1993 to assemble and maintain a list of the 500 most powerful computer systems. Our list has been compiled twice a year since June 1993 with the help of high-performance computer experts, computational scientists, manufacturers, and the Internet community in general who responded to a questionnaire we sent out; we thank all the contributors for their cooperation.

In the present list (which we call the TOP500), we list computers ranked by their performance on the LINPACK Benchmark. While we make every attempt to verify the results obtained from users and vendors, errors are bound to exist and should be brought to our attention. We intend to continue to update this list half-yearly and, in this way, to keep track with the evolution of computers. Hence, we welcome any comments and information; please send electronic mail to *top500@rz.uni-mannheim.de*. The list is freely available by anonymous ftp to

ftp.uni-mannheim.de/top500/ or to [www.netlib.org/benchmark/top500.ps](http://www.netlib.org/benchmark/top500.ps). The interested reader can additionally create sublists out of the TOP500 database and can make statistics on his own by using the WWW interface at <http://www.top500.org> or <http://www.netlib.org/benchmark/top500.html>. Here you also have access to postscript versions of slides dealing with the interpretation of the present situation as well as with the evolution over time since we started this project.

## 2 The LINPACK Benchmark

As a yardstick of performance we are using the “best” performance as measured by the LINPACK Benchmark [2]. LINPACK was chosen because it is widely used and performance numbers are available for almost all relevant systems.

The LINPACK Benchmark was introduced by Jack Dongarra. A detailed description as well as a list of performance results on a wide variety of machines is available in postscript form from *netlib*. To retrieve a copy send electronic mail to *netlib@ornl.gov* and by typing the message *send performance from benchmark* or from any machine on the internet type:

```
rcp anon@netlib2.cs.utk.edu:benchmark/performance performance.
```

The benchmark used in the LINPACK Benchmark is to solve a dense system of linear equations. For the TOP500, we used that version of the benchmark that allows the user to scale the size of the problem and to optimize the software in order to achieve the best performance for a given machine. This performance does not reflect the *overall performance* of a given system, as no single number ever can. It does, however, reflect the *performance of a dedicated system for solving a dense system of linear equations*. Since the problem is very regular, the performance achieved is quite high, and the performance numbers give a good correction of peak performance.

By measuring the actual performance for different problem sizes  $n$ , a user can get not only the maximal achieved performance  $R_{max}$  for the problem size  $N_{max}$  but also the problem size  $N_{1/2}$  where half of the performance  $R_{max}$  is achieved. These numbers together with the theoretical peak performance  $R_{peak}$  are the numbers given in the TOP500. In an attempt to obtain uniformity across all computers in performance reporting, the algorithm used in solving the system of equations in the benchmark procedure must conform to the standard operation count for LU factorization with partial pivoting. In particular, the operation count for the algorithm must be  $2/3n^3 + O(n^2)$  floating point operations. This excludes the use of a fast matrix multiply algorithm like “Strassen’s Method”. This is done to provide a comparable set of performance numbers across all computers. If in the future a more realistic metric finds widespread usage, so that numbers for all systems in question are available, we may convert to that performance measure.

### 3 The TOP500 List

Table 1 shows the 500 most powerful commercially available computer systems known to us. To keep the list as compact as possible, we show only a part of our information here:

• $N_{world}$	Position within the TOP500 ranking
• Manufacturer	Manufacturer or vendor
• Computer	Type indicated by manufacturer or vendor
• Installation Site	Customer
• Location	Location and country
• Year	Year of installation/last major update
• Field of Application	
• # Proc.	Number of processors <sup>1</sup>
• $R_{max}$	Maximal LINPACK performance achieved
• $R_{peak}$	Theoretical peak performance
• $N_{max}$	Problemsize for achieving $R_{max}$
• $N_{1/2}$	Problemsize for achieving half of $R_{max}$

If  $R_{max}$  from Table 3 of the LINPACK Report [2] is not available, we use the TPP performance given in Table 1 of the LINPACK Report [2] for solving a system of 1000 equations. To use a consistent yardstick for all systems we do not use results achieved by advanced parallel algorithm as defined in [2]. In case of the Cray T90, C90 and J90 systems we had to use older Table 3 or Table 1 results. In a few cases we interpolated between two measured system sizes.

For models where we did not receive the requested data, the performance of the next smaller system measured is used.

If there should be any changes in the performances given in Table 1 we will update them.

In addition to cross checking different sources of information, we select randomly a statistical representative sample of the first 500 systems of our database. For these systems we ask the supplier of the information to establish direct contact between the installation site and us to verify the given information. This gives us basic information about the quality of the list in total.

As the TOP500 should provide a basis for statistics on the market of high-performance computers, we limit the number of systems installed at vendor sites. This is done for each vendor separately by limiting the accumulated performance of systems at vendor sites to a maximum of 5% of the total accumulated installed performance of this vendor. Rounding is done in favor of the vendor in question.

In Table 1, the computers are ordered first by their  $R_{max}$  value. In the case of equal performances ( $R_{max}$  value) for different computers, we have chosen to order by  $R_{peak}$ . For sites that have the same computer, the order is by memory size and then alphabetically.

## 4 Statistics on Manufacturers and Continents

As basic statistics of the complete list, we give the number of systems installed with respect to the different manufacturers in the different countries or continents (Table 2) as well as the accumulated  $R_{max}$  values (Table 3) and  $R_{peak}$  values (Table 4) for those systems. More extensive analyses of the situation and its evolution over time can be found in the series of TOP500Reports (TOP500Report 1993 [3], 1994 [4], 1995 [5] and, 1996 [6]). Customized statistics can be obtained by using WWW at <http://www.top500.org> or <http://www.netlib.org/benchmark/top500.html>.

Table 2: Number of Systems Installed

TOP500 Statistics — Number of Systems Installed					
	USA/Canada	Europe	Japan	others	Total
IBM	67	67	2	5	141
SGI/Cray	92	27	12	2	133
SGI only	53	7	7		67
Cray only	39	20	5	2	66
Sun	76	29	4	4	113
Hewlett-Packard	33	10	2		45
Fujitsu	1	9	15	1	26
NEC	2	7	10	2	21
Hitachi		1	10		11
others	6	2	2		10
Total	277	152	57	14	500

Mannheim/Tennessee      November 11, 1999

Table 3: Installed  $R_{max}$

TOP500 Statistics — Installed $R_{max}$ [Gflop/s]					
	USA/Canada	Europe	Japan	others	Total
IBM	9134.9	4103.9	228.5	209.0	13676
SGI/Cray	13143.4	5516.9	685.3	191.5	19536.6
SGI only	5304.5	389.2	408.9		6102.6
Cray only	7838.9	5127.7	276.4	191.5	13434
Sun	3402.9	1073.6	136.7	191.6	4804.8
Hewlett-Packard	1636.2	472.0	91.0		2199.2
Fujitsu	45.9	1009.6	1660.6	139.8	2855.9
NEC	306.3	499.2	969.0	185.1	1959.6
Hitachi		58.7	2544.3		2602.9
others	3093.0	75.7	164.8		3333.5
Total	30763	12810	6480.1	916.9	50969

Mannheim/Tennessee      November 11, 1999

Table 4: Installed  $R_{\text{peak}}$ 

TOP500 Statistics — Installed $R_{\text{peak}}$ [Gflop/s]					
	USA/Canada	Europe	Japan	others	Total
IBM	16063	7858.5	374.9	319.8	24616
SGI/Cray	19264.5	7812.3	891.4	277.2	28245.5
SGI only	8044.5	511.2	533.8		9089.5
Cray only	11220	7301.1	357.6	277.2	19156
Sun	4260.2	1287.0	170.4	232.4	5950.0
Hewlett-Packard	3700.5	1086.7	197.1		4984.3
Fujitsu	48.4	1100.8	1845.0	144.0	3138.2
NEC	320.0	524.0	1010.0	192.0	2046.0
Hitachi		77.0	3184.0		3261.0
others	4643.2	144.0	265.1		5052.3
Total	48300	19890	7937.9	1165.4	77294
